

Social Network Analysis: Theory, Visualization, and Modeling

Narisong Huhe

University of Strathclyde,
narisong.huhe@strath.ac.uk

Outline

- 1 Network Theory
 - Overview
 - Networks and Politics
- 2 Network Typology
 - Case 1: Hub
 - Case 2: Triad
 - Case 3: Reciprocity
- 3 Summary
- 4 Research and Method
 - Basic Approaches
- 5 Single Networks
 - Some common models
 - ERGMs
- 6 Dynamic Networks

An interdisciplinary enterprise

- Euler's solution laid the foundations of **graph theory** and **topology**.

- Euler's solution laid the foundations of **graph theory** and **topology**.
- The roots of network science are particularly strong in **social psychology**, **sociology**, and **anthropology** (e.g., Granovetter, 1973).

An interdisciplinary enterprise

- Euler's solution laid the foundations of **graph theory** and **topology**.
- The roots of network science are particularly strong in **social psychology**, **sociology**, and **anthropology** (e.g., Granovetter, 1973).
- An increasingly number of **economists** also start to investigate the impacts of relational structure on economic activities (e.g., Jackson and Zenou, 2015)

An interdisciplinary enterprise

- Euler's solution laid the foundations of **graph theory** and **topology**.
- The roots of network science are particularly strong in **social psychology**, **sociology**, and **anthropology** (e.g., Granovetter, 1973).
- An increasingly number of **economists** also start to investigate the impacts of relational structure on economic activities (e.g., Jackson and Zenou, 2015)
- However, the recent increased visibility of network analysis is owed mainly to **statistical physicists** (e.g., Barabási and Albert, 1999).

Euler and seven bridges of Königsberg

- Problem: Can we devise a walk through the city that would cross each of those bridges once and only once?
- A **negative** resolution was provided by Euler in 1736.

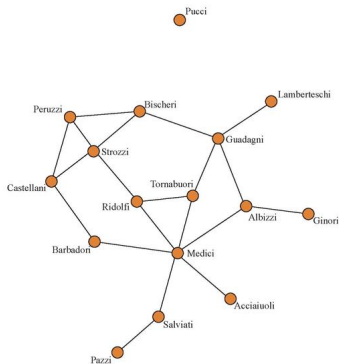

Network typology and Internet

■ Computer scientists and the development of Internet

From 2-player games to multi-player games

- Strategies in a networked setting (e.g., Jackson, 2010)
 - e.g., 15th Century Florentine marriage networks (Padgett and McLean, 2006)

Computational social science

- Stronger computational capacity and bigger data (e.g., Lazer et al., 2009)

Outline

- 1 Network Theory

Network theory in PoliSci

Embeddedness and interdependencies

- Targets: Atomic **agents** and rigid **structures**
 - e.g., the agent-structure debate in IR
 - the dominant statistical paradigm also reinforces the primacy of atomic agents

Embeddedness and interdependencies

- Targets: Atomic **agents** and rigid **structures**
 - e.g., the agent-structure debate in IR
 - the dominant statistical paradigm also reinforces the primacy of atomic agents
- A network perspective
 - Agents are not atomic; they are **embedded** in complex networks. (No iid)
 - Power and influence do not derive solely from agents' **attributes**; they can be results of agents' **positions** in a network. (Levels of analysis)
 - Structures are not rigid; they can be molded by **changing interdependencies** among agents. (Causal loops)

Embeddedness and interdependencies

- Targets: Atomic **agents** and rigid **structures**
 - e.g., the agent-structure debate in IR
 - the dominant statistical paradigm also reinforces the primacy of atomic agents
- A network perspective
 - Agents are not atomic; they are **embedded** in complex networks. (No iid)
 - Power and influence do not derive solely from agents' **attributes**; they can be results of agents' **positions** in a network. (Levels of analysis)
 - Structures are not rigid; they can be molded by **changing interdependencies** among agents. (Causal loops)
- The nature of networks leads to **dependence between actors** and also to **dependence between network ties**.

Basic rationales: From local to global

- The ideas of embeddedness and interdependence are attractive, but how to study **complex networks**?

Basic rationales: From local to global

- The ideas of embeddedness and interdependence are attractive, but how to study **complex networks**?
- From **local dynamics** to **global patterns**
 - social network theories focus on local dynamics and how they generate complex global networks

From local competition to global evolution

*Photographically reduced from Diagrams of the natural size (except that of the Gibbon, which was twice as large as nature),
drawn by Mr. Waterhouse Hawkins from specimens in the Museum of the Royal College of Surgeons.*

From local rational persons to global equilibrium

Case 1: Hub

Case 1: Hub

Scale-free network (Barabási and Albert, 1999)

- Two assumptions:
 - a network is growing gradually
 - new comers have slightly higher chances to connect with the popular nodes (i.e., preferential attachment)

Scale-free network (Barabási and Albert, 1999)

- Two assumptions:
 - a network is growing gradually
 - new comers have slightly higher chances to connect with the popular nodes (i.e., preferential attachment)
- Result: A hub-and-spoke network and it is scale free.

Scale-free network (Barabási and Albert, 1999)

- Two assumptions:
 - a network is growing gradually
 - new comers have slightly higher chances to connect with the popular nodes (i.e., preferential attachment)
- Result: A hub-and-spoke network and it is scale free.
- Evidence:
 - WWW, Facebook, metropolitan cities, ...
 - Cederman (2003): Sizes of war
 - Baumgartner, Box-Steffensmeier and Campbell (2018): Executions in US

Case 1: Hub

Cederman (2003)

FIGURE 1. Cumulative Frequency Distribution of Severity of Interstate Wars, 1820–1997

Source: COW data.

Case 1: Hub

Simulation time!

- Why **inequality** persists in human society (e.g., capitalism)?
- Is it **fair** (e.g., meritocracy)?

Case 1: Hub

Simulation time!

- Why **inequality** persists in human society (e.g., capitalism)?
- Is it **fair** (e.g., meritocracy)?
- Simulation 1: Matthew effects, “the rich get richer and the poor get poorer”
- Simulation 2: Talent vs luck

Case 2: Triad

Outline

- 1 Network Theory

Hunting flats

Case 2: Triad

Strong ties, weak ties, and a small world

- My story: Richard told me that Neil had a mortgage friend good at handling cases like mine.
- Two kinds ties
 - type 1: me \leftrightarrow Richard, Richard \leftrightarrow Neil, me \leftrightarrow Neil
 - type 2: Neil \rightarrow the mortgage guy

Case 2: Triad

Strong ties, weak ties, and a small world

- My story: Richard told me that Neil had a mortgage friend good at handling cases like mine.
- Two kinds ties
 - type 1: me \leftrightarrow Richard, Richard \leftrightarrow Neil, me \leftrightarrow Neil
 - type 2: Neil \rightarrow the mortgage guy
- Granovetter (1973): the “strength of weak ties”
 - While strong ties bond, weak ties bridge.

Case 2: Triad

Strong ties, weak ties, and a small world

- My story: Richard told me that Neil had a mortgage friend good at handling cases like mine.
- Two kinds ties
 - type 1: me \leftrightarrow Richard, Richard \leftrightarrow Neil, me \leftrightarrow Neil
 - type 2: Neil \rightarrow the mortgage guy
- Granovetter (1973): the “strength of weak ties”
 - While strong ties bond, weak ties bridge.
- Watts and Strogatz (1998) formalize the idea (also see “Six Degrees of Separation”)
 - the network is numerically large
 - the network is sparse
 - the network is decentralized
 - the network is highly clustered

A small-world network

- 6 Dynamic Networks

How to (un)make friends

what are other
words for
reciprocity?

reciprocality, reciprocation,
cooperation, interaction,
interchange, mutuality,
exchange, teamwork, interplay

How to (un)make friends: Axelrod (1984)

Confucius and reciprocity

Analects 15.24 *Zigong asked: "Is there a single teaching that can be practiced to the end of one's life?" Confucius replied: "It is reciprocity! What you don't desire for yourself, do not desire for others."*

Network dependencies

- **Degree differentials** refer to the tendency that some actors are highly connected and others have few connections.

Network dependencies

- **Degree differentials** refer to the tendency that some actors are highly connected and others have few connections.
- **Transitivity** of ties is expressed by the saying “friends of my friends are my friends.”

Network dependencies

- **Degree differentials** refer to the tendency that some actors are highly connected and others have few connections.
- **Transitivity** of ties is expressed by the saying “friends of my friends are my friends.”
- **Reciprocation of directed ties** is a basic feature of social networks.

Network dependencies

- **Degree differentials** refer to the tendency that some actors are highly connected and others have few connections.
- **Transitivity** of ties is expressed by the saying “friends of my friends are my friends.”
- **Reciprocation of directed ties** is a basic feature of social networks.
- **Homophily** denotes the tendency of similar actors to relate to each other.

Network dependencies

- **Degree differentials** refer to the tendency that some actors are highly connected and others have few connections.
- **Transitivity** of ties is expressed by the saying “friends of my friends are my friends.”
- **Reciprocation of directed ties** is a basic feature of social networks.
- **Homophily** denotes the tendency of similar actors to relate to each other.
- There are many other important types of dependencies.

Bringing back agent attributes: McPherson, Smith-Lovin and Cook (2001)

Basic Approaches

 - Some common models
 - ERGMs
- 6 Dynamic Networks

ERGMs (a.k.a. p^* models)

- ERGMs assume Markov dependence for distributions on network.

ERGMs

ERGMs (a.k.a. p^* models)

- ERGMs assume Markov dependence for distributions on network.
- Conditioning on the other random variables, two random variables are **independent** unless they are tied.

- ERGMs assume Markov dependence for distributions on network.
- Conditioning on the other random variables, two random variables are **independent** unless they are tied.
- A stochastic graph, $X = (X_{ij})$, is a Markov graph if, for each set of four distinct nodes $\{i, j, h, k\}$, the random ties X_{ij} and X_{hk} are conditionally independent, given all the other random variables in X .

ERGMs

- A generalized Markov graph model incorporates any kind of dependence between tie variable (Cranmer and Desmarais, 2010),

$$\Pr(Y = y) = \frac{1}{\kappa} \exp \left\{ \sum_A \eta_A g_A(y) \right\} \quad (1)$$

where,

- 1 the summation is over all configuration types A ; different sets of configuration types represent different models;
- 2 η_A is the parameter corresponding to configuration of type A ;
- 3 $g_A(y)$ is the *network statistic* corresponding to configuration A (for homogeneous Markov graph models, this is the number of configurations of type A observed in the network: for example, the number of triangles); and
- 4 κ is a normalizing quantity to ensure that (1) is a proper probability distribution.

Longitudinal relational data

- Modeling network dynamics is less complicated than modeling single network observations.
 - Dependencies are spread out in time.
